

Trauma Anesthesia

Trauma patients present unique challenges to anesthesiologists. Acute injuries require resource intensive care and are often complex cases especially when coupled with underlying, preexisting medical conditions. Anesthesiologists are involved with trauma patients beginning with airway and shock resuscitation, continuing with intraoperative care during surgery, and extending on to pain management and critical care post-operatively. This new reference focuses on a broad spectrum of traumatic injuries and the procedures anesthesiologists perform to adequately care for trauma patients perioperatively, surgically, and post-operatively. Special emphasis is given to the assessment and treatment of coexisting disease. Numerous tables and 300 illustrations showcasing various techniques of airway management, shock resuscitation, echocardiography and use of ultrasound for the performance of regional anesthesia in trauma, provide an invaluable reference for the anesthesiologist.
