

# Interventional Ultrasound

Modern sonography makes possible the detection of small and subtle changes in the normal echo pattern. These may represent significant pathological changes which can not always be fully revealed by the echo pattern alone. There is, therefore, an increasing need for the supplement of the ultrasonically guided percutaneous puncture, which can be performed with great accuracy and with virtually no risk. Also, ultrasonically guided puncture has proven invaluable for a wide variety of therapeutic purposes. The first percutaneous puncture guided by ultrasonic scanning using a specifically designed transducer was performed in 1969 at the ultrasonic laboratory in Gentofte, now Herlev, Hospital, Copenhagen. The idea was based on a puncture transducer described and used by Kratochwill for puncture under the guidance of the ultrasonic A-presentation technique. The development in the field formed the basis of the First International Conference on Ultrasonically Guided Puncture at Herlev Hospital in 1978 sponsored by The Danish Society of Diagnostic Ultrasound. The knowledge and experience of the speakers at that conference was compiled in the book *Ultrasonically Guided Puncture Technique* published in 1980. Since then the Society has sponsored a conference at the same place in 1980 and 1983, the latest conference being termed Third International Conference on Interventional Ultrasound.

**Selected Ultrasound-Guided Procedures - AIUM** In order to perform precise and accurate Biopsies and Percutaneous Interventional Procedures, image quality for the needle guidance has to be at its highest **Interventional ultrasound: a critical overview on ultrasound-guided** The use of ultrasonography as a guide for local injections or for the placement of catheters, needles, or probes into body cavities or tumors.
